

## ABSTRACT

Stylized digital content is rapidly created by reading a first file and a plurality of second files. The first file contains a digital content item and each second file contains at least one style definition. At least one display instance of stylized digital content is created by applying the style definition of one of the plurality of second files to the digital content item of the first file. The at least one display instance is mapped to a location on the display device. A location is received from a pointing device and one of the plurality of display instances is displayed based on the received location.
